RESULT 1154

```
The sequence is that of a PCR primer plas which was used in the isolation of DNA encoding a major subunit of the Duffy blood group antigenic system, the gp-Fy proteins. The gp-Fy proteins are gp-Fy alpha and gp-Fy beta which are produced from the same gene wis a mRNA spliting mechanism. It contains the major receptor by which plasmodium vivax enters red blood cells (RBC) and causes malaria. The proteins are thus useful in protein or certain fragments of it, may also be used to generate antibodies, complementary peptides and drugs modelled on their tertiary structure, useful in the same way
                                                              The present sequence is a human papillomavirus 6 (HPV6) specific typing probe. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding gp-Fy, Duffy antigen proteins - used to prevent vivax malaria and to regulate erythrocyte, neural or renal function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gp-FY protein; Fyb71-81; duffy blood group; antigen; alpha; beta;

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human papillomavirus (HPV) L1 type-specific probe of the invention. This sequence may be used in conjuncture with L1 specific primers for detecting and typing HPV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Primers hTSCex19 forward and reverse (see AAV40603 and AAV40604, respectively) are designed to amplify exon 19 of the human hTSC gene (see AAV40651) that codes for thiaride-sensitive Na-Cl cotransporter TSC (see AAV20681). Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40658) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome allows for the genetic diagnosis of this disorder. The invention provides products and methods useful for disorders and treatment of Gitelman's syndrome and other ion transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thiazide sensitive cotransporter and ATP sensitive potassium channel genes - useful for developing products for the diagnosis and treatment of ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endomen: dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a PCR primer for the gene encoding the prostate specific antigen, and were used in the method of the invention. The method is for identifying markers for a disease state, and comprises: (a) providing a clirat set of peripheral blood mRNAs from one or more normal subjects known to exhibit the disease state and a second set of peripheral blood mRNAs from one or more normal subjects to fmRNAs trom one or more normal subjects of mRNAs to provide nucleic acid amplification products; (c) comparing the sets of mRNAs to provide nucleic acid amplification products; (c) comparing the sets of an expectation products; (d) dentifying those mRNAs that are disease state; where a difference in quantity of expression of an mRNA is indicative of a disease marker. The identified marker sequence the disease state; where a difference in quantity of expression of an mRNA is indicative of a disease marker. The identified marker sequence concluded in a method of detecting a metastatic cancer disease state, especially for detection prostate cancer. Using the methods, a disease state may be detected, diagnosed, or a prognosis may be delivered by examining a blood sample rather than relying on a more invasive, or less transmitive test. In addition, a subject may be monitored for disease to grogression, status and response to therapies through monitoring of differentially expressed disease markers. The methods can be used for disease such as cancer (especially metastatic or prostate concer (especially metastatic or grossate solved), asthma. Hupus erythematosus, rheumatoid arthritis, multiple sclerosis, interstitial cystitis, prostatis or other systemic or chronic conditions interstitial cystitis, prostatis or other systemic or directing and prostates or other systemic or directions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic calls of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene present in a population and targets only one allelic forms present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plague, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 14; Fig 1; 605pp; English.

99WO-US006488 24-MAR-1999;

This sequence represents human prostate specific antigen (PSA) PCR primer #15, used with PCR primer #16 (AA230747) in experiments to confirm whether a sample of total call RNA treated with DNAssel is completely free of DNA. If contaminating DNA is present, these primers will amplify a PCR product, which can be visualised via agarose gel electrophoresis. Once DNA has been completely removed from total cell RNA, the RNA can be used as a template for relative quantitive reverse transcriptase-PCR (RT-PCR) amplification of novel markers of human disease. PCR (RT-PCR) amplification of novel markers of human disease (AA230713-Z30719). These markers are differentially expressed in peripheral leukocytes between healthy subjects and patients with metastatic cancers (especially those of the prostate or breast). Detecting levels of such human disease (CC markers is used for diagnosis (also prognosis and monitoring) of diseases, including metastatic or organ-confined cancers, and diseases which also elicit an immune response such as asthma, lupus erythematosus, the particular way trivils, multiple sclerosis, mysathenia gravis, autoimmune thyroiditis, amyotrophic lateral sclerosis (ALS), interstitial cystitis and prostatitis but especially metastatic prostatic and breast cancer and benign prostatic hypertrophy, and between prostatic cancer and benign prostatic hypertrophy, and between advanced and localised prostatic cancers cancer by multivariate analysis of several different markers. Cancers cancer by multivariate analysis of several different markers. Cancer of disease markers. The method detects a leukocyte response to disease rather than products of disease can be detected at an early stage, when few, if any, diseased cells are present in the inverse or or ordining amples eliminates the present in the inverse or ordinarion and products of disease can be researed for more inverse or ordinarion. Identifying markers of human disease, specifically for diagnosis of metastatic prostatic and breast cancers. This invention describes novel thrombogenic polypeptides which comprise a thrombogenic substructure and a context-dependent entity which recognizes desired biologically susceptible sites, e.g. tumour vascular endothelium. A novel context-dependent functional entity comprises a substructure with having the ability to recognize desired biologically susceptible sites, where the entity imparts thrombogenic activity when positioned in the function-forming-context at the biologically susceptible sites, and the printly has no thrombogenic activity absent a function-forming-context at the biologically susceptible sites, the context-dependent functional entities impart thrombogenic activity only at biologically susceptible sites. The context-dependent functional entities impart thrombogenic activity only at biologically susceptible sites. The context-dependent functional entities impart thrombose the obliterate vasculative malformations or to selectively thrombose the vasculature of solid tumours. This sequence represents a human plasminogen FCR primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human ABC1 cholesterol transporter; chromosome 9q31;

The invention relates to the human ABC1 cholesterol transporter protein CB1818032 and to nucleic acid sequences (C69120) which encoded it. ABC1 is a member of the ATP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly of intracellular cholesterol trafficking in momocytes and fibroblasts, being involved in cholesterol trafficking in momocytes and fibroblasts, being cinvolved in cholesterol trafficking in momocytes and fibroblasts, being cinvolved in cholesterol efflux from the cell. The gene are associated with two genetic PMD (High density lipoprocein) deficiency discases compared to the familial HDL deficiency (FHA). These diseases compared in that TD is an autosomal recessive diseases compared to the particularly coronary artexy disease, but also cerebrovascular disease, particularly coronary artexy disease, but also cerebrovascular disease, compared to the propheral vascular disease. Conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and craftovascular disease. Computation for transgenic cells and non-human animals comparised pluman ABC1 nucleic cardiovascular disease compounds which mined ABC1 activity, compounds which compounds which mined ABC1 activity, compounds which mined ABC1 activity, compounds which mined ABC1 activity, compounds which compounds which mined ABC1 activity, compounds which mined ABC1 activity, compounds which attains and nucleotides can be used to trace or correspond to the cardiovascular disease, occonary restenois or peripheral vascular disease. They may also be used in the treatment of disease, Niemann-Pick disease, Huntington's disease, compounds which as alzeber a patient has an expensed and nucleotides can be used to trace or cerebrovascular disease, compounds which and adendate a patient as associated with ABC1 proteins and methods of screening or peripheral vascular disease, Human ABC1 proteins and methods or peripheral vascular

continuers AAZ60647-48 were used to amplify cDNA fragments of the murine kappa3 opioid receptor (muopioid receptor-1, KOR-3). The specification describes four new exons of the KOR-3 gene, which combine to yield seven new KOR-3 splice variants of human, mouse and rat origin. These splice variants are potential targets for modulating morphine analgesia and opioid-mediated ingestive responses. The KOR-3 polypeptide are used to careen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastrointestinal analgesics or more generally agents that affect gastrointestinal morphine, e.g. regulators of peristalsis. Antagonists, agonists and ligands of KOR-3, as well as DNA vectors expressing KOR-3-encoding nucleic acids, or sequences antisense to XOR-3 nucleic acids, are used to regulate morphine analgesia and body weight. The level of KOR-3 or tissue distribution of KOR-3 can be measured to diagnose KOR-3 related pharmacological abnormalities or neuroendocrine disorders, particularly gene, or with endogenous alleles deleted, are used to study loss or gain of function phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                         New splice variants of the kappa-opioid receptor, useful in screening for selective analgesics and for regulating morphine analgesia or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Splice variant; kappa3 opioid receptor; muopioid receptor-1; KOR-3; morphine analgesia; opioid-mediated ingestive response; opioid; manalgesic; gastrointestinal motility; respiration; immune system; endocrine system; autonomous nervous system; peristalsis regulator; body weight; neuroendocrine disorder; PCR primer; 88.

contribes four new axons of the KOR-3). The specification describes four new axons of the KOR-3 gene, which combine to yield seven new KOR-3 splice variants of human, mouse and rat origin. These splice variants of human, mouse and rat origin. These splice variants are potential targets for modulating morphine analgesia and opioid-mediated ingestive responses. The KOR-3 polypeptide are used to opioid-mediated ingestive responses. The KOR-3 polypeptide are used to coreen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastrointestinal continuous patents. Antagonists, agonists and systems, e.g. regulators of paristalsis. Antagonists, agonists and systems, e.g. requences antisense to KOR-3 nucleic acids, or sequences antisense to KOR-3 nucleic acids, are used to regulate morphine analgesia and body weight. The level of KOR-3 or tissue distribution of KOR-3 can be measured to diagnose KOR-3 related particularly contribed disorders. Transgenic animals with extra copies of the KOR-3 gene, or with endogenous alleles deleted, are used to study loss or gain of function phenotypes
                                                                                                                                                                                                                                                                  New splice variants of the kappa-opioid receptor, useful in screening for selective analgesics and for regulating morphine analgesia or body

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention bave a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3036, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ65554 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6794 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haphortyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroscheosis, mycoardial infarction, concary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclarosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

```
The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR. or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated
useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligomucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or oligonucleotides are useful for determining the presence, absence or cleantity of a SNP and for genotyping nucleic acid sample by performing a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or cleantity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotypic of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. caused by one or more SNPs. Phenotypic traits include disease.

Caused by one or more SNPs. Phenotypic traits include disease e.g. osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple solerosis, microorganism. The method is also useful in forensic investigations and microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Probes AAFS5160-76 were used to identify a human hypocretin (orexin) receptor 1 (HCRTR1) gene. The HCRTR1 gene is present on chromosome 1, location 1pp3. It is likely that a mutation in the HCRTR1 gene is associated with narcoleps. HCRTR1 is a central nervous system modulator. The HCRTR1 polypeptide and polynucleotide are useful for diagnosing or treating narcolepsy in an individual. The HCRTR1 polynucleotide is a source of probes and primers, and is also used to produce the protein recombinantly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, single nucleotide polymorphic; SNP; forensic science; paternity testing; phenotypic trait; genetic mapping; animal breeding; plant breeding; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic fibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including initiation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restenosis following coronary andioplasty. The ligands have improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, hypocretin receptor 1; orexin receptor 1; HCRTR1; chromosome 1; 1p33; central nervous system modulator; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid ligands to basic fibroblast growth factor that are useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability.
                                                                                                                                                                                                                   Ligand; basic fibroblast growth factor; bFGF; gene therapy; vascular; atherosclerosis; angioplasty; stability; ss.

The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selenoprotein; HIV; Ebola virus; cancer; immune system disorder; ss.

The present sequence comprises a probe for human papillomavirus (HPV)

C genotyping that was used in an example of the use of hairpin probes in

C mucleic acid hybridisation analysis. The probe sequence is present within

the 5' stem portion of an RNA-DNA probe (see ABA91521) that is capable of

C forming a hairpin structure. The DNA portion of the hairpin probe

c includes methylphosphorates. The hairpin probe is immobilised onto a

membrane by BSA conjugation and the resulting probe-containing strip is

c contacted with HPV genomic DNA. After hybridised probe with RNA-DNA

structure. A second hybridisation is then performed using biotin-labelled

c probes, which are complementary to the portions of immobilised probe that

c probes, which extraptaridin-horseradish percoxidase conjugate

c become single-stranded after hybridisation and digestion. Biotin in the

chemiluminescence. This is an example of the use of hairpin probes that

c are capable of both intramolecular and internolecular hybridisation and

c in which the nucleotide sequence that is complementary to the target

c hairpin probe. The use of such probes reduces background hybridisation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention

Nucleic acid comprising single nucleotide polymorphisms, useful in forensics, paternity testing and diagnosis of disease. Cargill M, Ireland JS, Lander ES; Claim 1; Page 46; 96pp; English. 19-JAN-2000; 2000US-0176861P.

The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Miskott-Aldrich syndrom, Fabry's disease, amilial hyperoflosiserolaemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis telangiectesia, familial colonic polyposis, Ehrers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria, syndrome of, or susceptibility to, multifactorial diseases of which a component is or may be genetic, such as autoimmune diseases of which a component is or may be genetic, such as autoimmune diseases of the component is or may be genetic, such as autoimmune diseases including rheumation, anterior, diseases of the rervous system, and incertion by pathogenic microorganisms, autoimmune diseases including rheumation arthritis, multiple sclerosis, diabetes (insulin-dependent) systemic lupus erythematous and graves disease, cancers including cancers of the bladder, brain, breast, colon, oesophagus, kidney, leukaemia, liver, lung, oral cavity, ovary, pancreas, prostate, skin, stomedo and uterus, longevity, appearance (e.g., baldmess, skin, stomedo and uterus, longevity, appearance (e.g., baldmess, skin, stomedo and uterus, longevity, appearance (e.g., baldmess, and pateriorial drugs or therapeutic treatments), in forensics and in paterinity testing, ABSK6581-ABK65841 represent human single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKB1), tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein (KAK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the mucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful

haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, disgnosing, treating, preventing various disorders such as angloedaema and diseases which involve anglogenesis like haemangiomas, tumours, sarcomas, Crohn's involve anglogenesis like haemangiomas, tumours, arcomas, Crohn's diseases, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertension, heart failure, myocardial infarction, ventricular hypertension, heart failure, myocardial infarction, ventricular hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory artery disease, ancer, wounds, viral, bacterial or fungal infaction, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polymucleotides are also useful for chromosome identification Antibodies and biological samples. The present sequence is included in the sequence and biological samples. The present sequence is inthe specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Aminopeptidase P; XPNEP2; bradykinin receptor B1; ds; BDKRB1; tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; kallikrein 1; KLK1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACR2; protease inhibitor 4; P14; polymorphism, haemandioma; tumour; sarcoma; Crohn's disease; trachoma; cardiovascular disease; angina pectoris; hypertension; heart failure; myocardal infarction; ventricular hypertrophy; vascular disease; ansurysm; embolism; thrombosis; coronary artery disease; angioedaema; arteriosclerosis; atherosclerosis; hypersensitivit; sepsis; autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; fungal diffection; COPD; chronic obstructive pulmonary disease; enterocolitis.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (KPNBP2), bradykinin receptor B1 (TACR1), C1 esterase inhibitor (CINH), kallikrein techykinin receptor B1 (TACR1), C1 esterase inhibitor (CINH), kallikrein (CC 1 (KLK1), bradykinin receptor B2 (TACR2), angiotensin converting enzyme 2 (ACR2) or protease inhibitor 4 (F14), comprising at least one copolymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a colymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additionals and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising control of analysing (M1) at least one nucleic acid sample comprising control of analysing (M3) an individual at risk of developing a disorder (1) apploxypes using the genes comprising grouping at least two nucleic acids confinistration of an ACB inhibitor and/or vasopeptidase inhibitor using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a comprise or more polymorphic positions within a gene encoding a comprise or more polymorphic positions within a gene encoding a comprise or more polymorphic positions within a gene encoding or nucleotide present in at least one polymorphic position, and comparing (CC nucleotide present in at least one polymorphic position, and comparing the sent of preventing various disorders such as angloedaema and diseases which conventing various disorders such as angloedaema and diseases, trachomas, and cardiovascular diseases, involve, various diseases, neutrysm, embolism, thrombosis, cronary cartery disease, arterioeners and cardiovascular diseases, neutring, viral, bacterial or fungal infection, coherturing viral, bacterial or fungal conventing viral, and diseases and diseases in the proportical or convention. The provise and diseases and diseases and diseases a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polymucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDXRB1), cleatezase inhibitor (CNH), kallikrein tachykinin receptor B2 (BDXRB2), angiotensin converting enzyme (KLKA), bradykinin receptor B2 (BDXRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one properties of polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additionals and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample from one or more polymorphic positions in a gene nucleic acid sequence at one or more polymorphic positions in a gene condition a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acid sequence; (2) analysing (M3) an individual at risk of developing a disorder using the polymorphic positions within a gene encoding a comprises one or more polymorphic positions within a gene acids, each of which human protein selected from the group above; and (6) genotyping (M4) an individual compraining a nucleic acid sample, determining the least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, and compositions are useful for detecting, associated and disease which and compositions, and compositions, and compositions, and compositions, and cangosition with a known data set. The genes, (M1, M2, M3 and M4) and composition, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, and cardiovascular diseases like anging pertoris, hypertrophy, vascular diseases, and cardiovascular manalymorphic position, thrombosis, archomas, sepase (COPD) and energocilis (COPD) and entercoclists). The polymuc New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and

The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (ALINM). (I) is useful for modulating signal transduction into a cell mediated by ALILM, for modulating proliferation of ALIM-expressing cells, for modulating production of a cytokine from ALIM-expressing cells, and for inducing antibody-dependent cytotoxicity against ALIM-expressing cells and/or immune cytolysis or apoptosis of ALIM-expressing cells and/or immune cytolysis or apoptosis of ALIM-expressing cells. (I) is useful for treating, preventing or prophylaxis of delayed type allergy. (I) is useful for treating and preventing various diseases associated with ALIM-mediated costimulatory transduction, and for inhibiting the onset and/or advancement of the diseases. (I) is useful for suppression, prevention and/or treatment of

The invention relates to an immunogenic composition of mycobacterial mutants with modified protein production capabilities. The invention also relates to methods for the treatment and prevention of infectious diseases. The methods and compositions of the invention are useful for such as tuberculosis and Crohn's disease. The invention is also used in such as tuberculosis and Crohn's disease. The invention is also used in gene therapy. The present sequence is a PCR primer used for amplifying Mycobacterium sp. hsp70 (heat shock protein 70) operon promoter. This

The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular proliferative disorder of breast tissue is indicative of a cellular may be TWIST, HOXAS, NES-1, retinoid, acid receptor beta (RARbeta), oestrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, HN-10 r RASSFA. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular breast cancer including ductal carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, intraductal carcinoma, medullary carcinoma in situ and papillary carcinoma in situ. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proliferative disorder of breast tissue, in particular breast cancer, by determining the state of methylation of one or more nucleic acids isolated from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Davidson N, Fackler MJ;

```

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known molecule comprising at least one base variation from that of a known wolecule comprising at least one base variation from that of a known them cytochrome P450 A1 (CYP4501A1), adrenergic receptor beta1 (ADDR1), cytochrome P450 02E1 (CYP4501A2), adrenergic receptor beta1 (ADDR1), aryl hydrocarbon receptor nuclear translocator (ARNT), cathepsin 8 (CYS2), cytochromes 2 (EPK2), 5-lipoxygenase activating inhibitor (DB1), epoxide hydroxylase 2 (EPK2), 5-lipoxygenase activating protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl transferase (HNWT), NADPH quinone oxidoreductase 2 (NQO2), cransferase (HNWT), NADPH quinone oxidoreductase 2 (NQO2), cransferase (HWT), NADPH quinone oxidoreductase 2 (NQO2), transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase (UGT2B1), urokinase receptor (UPA), multidrug resistance 1 (MDR1), lactotransferzin (UTF), unltidrug resistance associated protein 3 (MRP3), orphan nuclear receptor (NRII2), or acetylcholine muscarinic Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cyrcokrome p450 and cathepain S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits. Example 9; Page 115; 714pp; English. 28-NOV-2000; 2000US-00724389. (DNAS-) DNA SCI LAB WPI; 2002-698522/75. Guida M, Hall J; 

```
The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that are responsible for specific traits within the genome and evantually identifying the genes responsible for a variety of disorder-related traits as a result of their e.g., overexpression, constitutive capression, mutation or underexpression, which may be used in diagnosing and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYP4501B1, ARNY, BEHZ, GST12, NNMY, NQC2, NR.12, STW, UGT2B4, UGT2B5, AHR, MDR1 and/or MDR3 may also be screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYP4501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for altered central eusect to screen for altered cardiovaccular function, in COX2 for altered central nervous system function, in FLAP and HNNM for altered pulmonary, immunological or haematological function, in FLAP and HNNM for altered serine function, in FLAP and HNNM for altered central and mannal parameter of the present sequence represents a peripheral nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention describes a polymuclectide (I) of the endothelin (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (III) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cardiovascular disease molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE ö Novel polynucleotide of the endothelin/endothelin converting enzyme signaling enzyme endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for treating the sulphides to form sulphoxide enantiomers for chiral drug synthesis. (I) is expressed in a transformed bacterium. The enantiomer formed is useful active producting a chiral drug. (I) is useful for synthesis of optically-active functional groups of drug. DNA encoding (I) is useful for producing a strain of DMS: acceptor oxidoreductase-deficient Rhodovulum sulfidophilum, which is useful in whole-cell reaction, where DMS:acceptor oxidoreductase activity is unwanted. ABK53751-ABK53805 represent R. sulfidophilum DMS:acceptor oxidoreductase subunit coding sequences and Endothelin; EDN; endothelin converting enzyme; ECB; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; andjogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss. signaling system or its gene product. The isolated proteins and polynucleotides encoding them are useful for preparation of a pharmacutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a polymucleotide (I) of the endothelin (EDNR)/endothelin converting enzyme (ECE)/receptors of EDN and BCE (EDNR) signaling system which is associated with a cardiovacular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector [III] expressing (I) or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovaccular disease. (II), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gane comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a

```
molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system
or its gene product, or for identifying and obtaining an inhibitor of the
activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE
signaling system or its gene product. The isolated proteins and
polymucleotides encoding them are useful for preparation of a
polymuclatical composition for treating a cardiovascular disease such as
coronary heart disease, hypertension, atherosclerosis, or related to
abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial
hypertoholesterolaemia. The gene or a polymucleotide fragment of the
carding a transgenic animal and in creation of a solid support
comparising polymucleotides, genes, vectors, polypeptides, antibodies or
comparising polymucleotides, genes, vectors, polypeptides, antibodies or
comparising polymucleotide polymorphisms in DNA encoding
cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; interleukin 4 receptor; IL4R; type 1; diabetes; allele; insulin dependent diabetes mellitus; IDDM; myasthenia gravis; single nucleotide polymorphism; SNP; autoimmune disease; T helper type 1 mediated disease; rheumatoid arthritis; probe; multiple sclerosis; inflammatory bowel disease; systemic sclerosis; systemic lupus erythematosus; psoriaais; scleroderma; Grave's disease; Guillain-Barre syndrome; Hashimoto's thyroiditis; se.

mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic acid sample of the individual, where the presence of the allele indicates the individual's risk for type I diabetes. The method identifies one or more single nucleotide polymorphism (SNP) within the IL4R gene listed in the specification. The method and the SNP's are useful for determining an individuals risk for type I diabetes. The IL4R SNPs are also useful for determining an individuals risk for any autoimmune disease or condition or any T helper type I mediated disease, e.g. rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, systemic lupus sclerosis, myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's thyroiditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in ABQ80153-69 represent probes which were used to identify wild type and variant loci in the human interleukin 4 receptor (IL4R). These probe sequences were used in the method of the invention for determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes and its to the method comprises detecting the presence of an insulin dependent diabetes and its to the individual, where the presence of the allele indicates the individual's risk for type 1 diabetes. The method identifies one or

detecting

The sequences given in ABQ80119-35 represent probes which were used to identify wild type and variant loci in the human interleukin 4 receptor (114R). These probe sequences were used in the method of the invention for determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes

The invention relates to a novel method for detecting a point mutation in a DNA strand. The novel method comprises hybridising a target DNA strand containing or suspected of containing a point mutation with a test mucleic acid strand complementary to the DNA strand to form a target DNA strand/test nucleic acid strand duplex, contacting the duplex with an strand/test nucleic acid strand duplex, contacting the duplex with an strand/test nucleic acid strand duplex, contacting the duplex with an nucleotide sequence are cleaved by RNAse H. The method is useful for detecting a point mutation in a DNA strand, where the point mutation to be detected is a single nucleotide polymorphism, preferably a contain the method is useful to detect any nucleic acids from any species of organisms such as Acintobacter, Bacillus, Candida, any species of organisms such as Acintobacter, Bacillus, Candida, This polymucleotide sequence represents a probe relating to the mutation detecting method of the invention
more single nuclectide polymorphism (SNP) within the IL4R gene listed in the specification. The method and the SNP's are useful for determining an individual's risk for type 1 diabetes. The IL4R SNP's are also useful for determining an individual's risk for any autoimmune disease or condition or any T helper type 1 mediated disease, e.g. rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, systemic lupus exthematosus, psoriasis, scleroderma, Grave's disease, systemic sclerosis, myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's thyroiditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting point mutation in DNA strand, by hybridizing target DNA strand having mutation with test DNA strand to form duplex, contacting the duplex with RNase H and determining the cleavage of test strand by RNase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Activation of potential matrix metalloprotease-2 (proMMP-2) with claudins via membrane type matrix metalloproteases (MT-MMPs).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ō
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes the activation of potential matrix metalloprotease-2 (proMMP-2) with claudins via membrane type matrix metalloproteases (WT-MMP). Activated proMMP-2 is useful for treatment neovascularisation and cancer. This sequence represents a potential matrix metalloprotease-2 activation associated primer. Note: This sequence is given in the specification as seq id 13.
                                                                                                                                                                                                                                                                                                vasotropic, cytostatic, potential matrix metalloprotease-2; proMMP-2; membrane type matrix metalloproteases; MT-MMP; neovascularisation; cancer; human; claudin 1; ss; primer.

                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel method of identifying candidate p53
pathway modulating agent which comprises contacting an assay system
comprising stearyl coenzyme A desaturase (SCD) polypeptide or nucleic
agent under conditions where, but for the presence of the test agent, the
system provides a reference activity. The p53 gene is mutated agent, the
system provides a reference activity. The p53 gene is mutated in over 50
idferent types of human cancer. The human p33 protein normally functions as
a central integrator of signals including DNA damage, hypoxia, nucleotide
optivation and oncogene activation. Modulators of p53 may have
a central integrator of signals including DNA damage, hypoxia, nucleotide
optivation and oncogene activation. Modulators of p53 may have
correct activity or be useful in gene therapy. The methods of the
invention are useful for identifying modulators of p53 pathway as
therapeutic targets for disorders associated with defective p53 function,
such as anglogenic, apoptotic or cell proliferative disorders, for
cample cancer. The modulators are useful as research reagents,
cample cancer. The modulators are useful as research reagents,
that of a human Stearoyl-coA desaturase 4 sequence (see ) small
interfering RNA (siRNA) used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                      Identifying a candidate p53 pathway-modulating agent as therapeutic targets for disorders related to defective p53 function e.g. cancer by contacting an assay system having SCD polypeptide or nucleic acid, with a

The present invention provides the gene, protein and cDNA sequences of the human melanocortin 2 receptor (adrenocorticotrophic hormone) (MC2R). Also identified are a number of single nucleotide polymorphisms (SNPs) found within the sequences. The sequences can be used to find the haplotype of the MC2R gene in an individual and to identify drugs for the reatment of cancer and familial glucocorticoid deficiency. The present sequence is an allele specific primer for the gene of the invention, which is found on chromosome 18q11.2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         constituent of gag gene of HIV-1 Bru, -Mal or -Eli, HIV-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1194
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAQ06909
```

```
The sequence is that of a detection step primer for use in the identification of a mutation (G -> A) in the second nuclectide of codon 12 of the N-ras gene. It corresponds to nucleotides 15 to 34 on the N-ras gene and was synthesised on an Applied Biosystems 381A DNA synthesiser. It allows the accurate determn. of changes in the N-ras gene with such efficiency and ease that large numbers of samples can be screened. See also AAQ13677-Q13689. (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of specific nucleotide variations - by primer extension using a detection step primer immediately adjacent the variable nucleotide.
                                                                                                                                         This nuclectide sequence is found in posn. 1388-1369 of HIV-1 Bru, 1421-1403 of HIV-1 Mal, 1388-1369 of HIV-Eli, 1706-1687 of HIV-2 ROD and 1670-1651 of SIV-MAC. It is the anti-sense strand of a primer pair used to amplify these HIV-1, HIV-2 and SIV viral sequences, esp. in conjunction with in vitro diagnosis of in-fection. It is useful for treating viral diseases, eg. AIDS. See also AAQ06905-08 and AAQ06910-54. (Updated on 09-JAN-2003 to add missing OS field.)
                                        New nucleotide sequences derived from genome of HIV-1, HIV-2 and SIV useful as primers for amplification of immuno-deficiency viruses in diagnosis and for raising antibodies in treatment of HIV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-ras gene codon 12 nucleotide variation detection step primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 2 C; 10 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This antisense oligonucleotide was designed to hybridise to the 3'-UTR thuman ICAM-1 mRNA. It was synthesised in the phosphorothicate form as none of the phosphodiester form-antisense oligonucleotides which were initially tested demonstrated inhibitory activity. Oligonucleotide #15 was found to be the most active of 16 potentially inhibitory anti-sense sequences. Its anti-sense activity was not shared by other oligonucleotides which hybridise to 3'-untranslated sequences. See e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotides hybridisable to cell adhesion modulators - for treatment and diagnosis of e.g. allograft rejection, cancer, AIDS etcand diagnosis of intercellular adhesion dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The sequences given in AAQ66488-90 are primers which were used in the method off the invention for the detection of a mutant oncogene. The method allows the detection and measuring a mutant oncogene contained in a sputum sample. PCR is performed by utilising the mutation position of the objective mutant oncogene as the complementary base to the 3' therminal at base of the PCR primer, and by using a mixture of three primers which are different from teh the normal sequence at the 3' terminus. Another primer is used to hold the mutant oncogene together so that the mutant oncogene can be amplified position specifically and detected. The oncogene is pref. the K-ras gene and the mutation to be detected is pref. either codon 12, 13 or 61. This method allows detection of a mutation which is present only in trace amounts in the test sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human intercellular adhesion molecule; ICAM-1; cell adhesion; modulation; inflammation; psoriasis; malignant melanoma; inflammatory bowel disease; antisense oligonucleotide; therapy; ss.
                                                                                                                                                                                                                                                                 Detection of variant oncogene by PCR amplification - using the mutation site as the complementary base to the 3' end of a PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 13.6; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
```

```
HBV core antigen (Ag) encoding sequences were subcloned and engineered so as to be transcriptionally controlled by a vaccinia or vaccinia-like promoter. A deleted version of the core gene, referred to as core delta
                                                                                                                                                                                                                                            Antisense oligonucleotides which target human ICAM-1 were synthesised in both the phosphodiester and phosphorothioate forms. The oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 1952-1971 of the 3'- untranslated region of the human ICAM-1 coding sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                     Oligo:nucleotide modulation of cell adhesion - used in the treatment of e.g. psoriasis, inflammatory bowel disease or malignant melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prevention and treatment of hepatitis - using recombinant replicable vaccinia viruses contg. hepatitis B virus surface and core antigen

8, in which 8 AAs are deleted, was used. A construct was made consisting of HBV MS antigen expressed from the modified p7.5 promoter and core delta 8 expressed from the p7.5 promoter. One primer used was AAQ67992 which hybridises from bases -230 to -211 relative to the ATG of core delta 8, upstream of the p7.5 promoter, and creases a HindIII site. A second primer (AAQ67993) hybridises to the opposite strand from bases +553 to +546 and generates a HindIII site. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ71022 and AAQ71023 are primers for the DNA sequence (AAQ79199) that codes for the rat mu-subtype opioid receptor (AAR65188). The amplified sequence is preferably a sequence between nuclectides 2470 and 3346 of the consensus sequence described in AAQ71479. The method is used for the detection of Brucella infection in animals, particularly humans and cattle. This probe specifically hybridises to sequences from Brucella abortus biovar 1, Brucella abortus biovar 5, Brucella melitensis, Brucella neotomae and Brucella ovis which are amplified by the primers described in AAQ71496 and AAQ71497. The use of an array of probes (See AAQ71495-509) allows specific identification of the species of Brucella. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                   Identification of Brucella species or biovars - by amplification of the Brucella omp2 gene locus and hybridisation with DNA probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glutamate receptor; EAAS receptor; excitatory amino acid; CNS receptor; RNA editing; polymerase chain reaction; PCR; primer; ss.

/note= "at least one (and preferably all) of the backbone
subunits are composed of amide units, so that the
oligomer consists of the nucleobases attached covalently
to a polyamide backbone"
                                                                                                                                                                                                                                                                                                                    PCR primers (AAQ91246-50) were used to amplify human glutamate receptor EAAAS genomic DNA and cDNA. Examination of the PCR products showed that the cDNA sequence differed from the genomic Sequence at 2 places in the transmembrane domain-coding region, resulting in S310A and R5220 substitutions. These variations were attributed to RNA editing involving T to G and G and A substitutions. Similar RNA editing was found for EAA3 (see also AAQ91231) and EAA4 (see also AAQ91232) genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

```
New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, coding region, 5-untranslated region or 3'-untranslated region or 12-untranslated region or 2 ELAM-1, or hybridisable to AUG region, coding region, 5'-untranslated region or 2 ELAM-1, or hybridisable to AUG region, coding region of CC region, exon/intron junction region or 3'-untranslated region of VCAM-1.

The PNAs can be used to target RNA and single stranded DNA (SDNA) to produce antisense-type gene regulation moieties. Hence they may be used the regulation moieties. Hence they may be used antimersetatic agents, anticancer agents, antimination and antimination and hus as an antimination and antihination and chis as an extend agents, anticancer agents, anticancer agents, anticancer agents, anticancer agents, antimination and all agents and antihination and obligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with the first PNA strand binds with the resulting double helix or which facilitates cellular uptake. Further, since they contain and antimination and processes no significant charge and are water coluble, which facilitates cellular uptake. Further, since they contain and second and processes. The present sequence targets human cutymanslated region human intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
New peptide nucleic acid oligomers hybridising to adhesion molecule genes - are stable anti:sense cpds. of high affinity, partic. for treating inflammation, viral infection, cancer etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wild-type multiple tumour suppressor (MTS) gene and mutant sequences - useful in diagnosis, prognosis and therapy of human cancer, e.g. melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

                                                      The cDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced, using various sequencing and amplification primers. AAQ99936-40 are oligonucleotides used to amplify cDNA encoding mouse MTSIEL-beta to allow comparison of the human and murtime sequences. MTS polypeptide-encoding CDNAs and mutants of these mutations of MTS cDNAs can be used for diagnosin of physics of these metalnoms of MTS cDNAs can be used for diagnosing predisposition to metalnoma. Leukaemia, astrocytoma, glioblastroma, lymphoma, glioma, glioblastroma, lymphoma, glioma, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for procein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ81115 is a peptide nucleic acid (PNA), which binds a target sequence. The binding of the PNA prevents the transcription of the target sequence
                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide nucleic acid; gene therapy; transcription arrest; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAQ81119 is a peptide nucleic acid (PNA), which binds a target sequence. The binding of the PNA prevents the transcription of the target sequence by RNA polymerase. The ability of the PNA to arrest transcription makes it useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-MAR-2003 to correct PN field.)
by RNA polymerase. The ability of the PNA to arrest transcription makes it useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-MAR-2003 to correct PN field.)

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) dene, using gene probes which hybridise to the MTSI gene (amplified using the PCR primers AAT00729-31). The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas,

A random probe was generated as a 1.5 kb product with the primers AAQ80944 and AAQ80945. The probes were used in the identification of cosmids from the beta-giardin genomic region in a diardia lamblia 20-genome equivalent cosmid library. This was part of a novel method for sequence-sampled mapping of complex genomes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ል
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequencing complex genomes, present as fragments in a cosmid library - k sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The antisense oligonucleotide (ON) shown is a derivative of an equivalent wild type Human ICAM ON, in which at least one, esp. 2-10, non-terminal pyrimidine nucleotide(s) is/are modified. The modification may be: (a) replacement of a phosphodiseter linkage by: a phosphoro-thioate (PS), dithioate, aramidate; borano-, alkyl-, aralkyl-phosphate; 2,2.2-trichloro-1, Idimethyl-, alkyl- or aryl- phosphonate linkage; or (3'-thio) formacetal, methylhydroxylamine, oxime, methylendedimethylhdrazo, thio) formacetal, methylhydroxylamine, oxime, methylenedimethylhdrazo, phosphate backbone by a "morphholinonucleoside" oligomer; (c) replacement of beta-D-2-deoxyribose by another sugar or carbocyclic, open-chain or bicyclic sugar analogue, or (c) replacement of the natural nucleoside base by an analogue, e.g. 5-hydroxymethyl-uridine The 5' and/or 3' terminus may also be modified with a lipophilic gp, eg, a farnesyl. The modifications increase nuclease resistance and thus improve stability and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. mRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primers T41001-T41382 are derived from novel human gene signature (GS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; primer; PCR; amplification; polymerase chain reaction; ss.
                  New anti:sense oligo:nucleotide analogues - with modified non-term
pyrimidine nucleotide units, useful for treating viral infections,

sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was determined (sp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41335-6 amplify clone pm0268 which comprises the GS HUMGS000995 (T19995). This amplification reaction gave prod. indistinguisable from the same PCR using mouse or Chinese hamster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A sense oligonuclectide S50 (AAQ99516) corresp. to nuclectides 50-69 in the human Fas ligand coding sequence given in AAT03498 was synthesised with phosphororhicate linkages. The complementary, antisense oligonuclectide A69 (AAQ99517) was also synthesised. The effects on Fas ligand-mediated apoptosis of A69 and S50 were analysed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide which binds to Fas antigen, and antibody reactive with it - for treatment and diagnosis of viral or auto:immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fas ligand, Tumour Necrosis factor family; apoptosis; cell death; Fas cell surface antigen; human; Fas-L; phosphorothioate; antisense oligonucleotide; inhibition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human Fas ligand phosphorothioate antisense oligonucleotide A69.

New oligo:nucleotide(s) contg. 8-aza:purine base - useful as therapeutic and diagnostic agents with more stable hybridisation to target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAT44425-54 are antisense oligonucleotides which have at least one 8-azapurine base. The presence of an 8-azapurine base results in significantly stronger complexing when hybridising to target nucleic acids. The present sequence is against the intracellular adhesion molecule (ICAM) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense therapy, guanosine, intercellular adhesion molecule, ICAM, nuclease resistance, stability; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A sense oligonucleotide S50 (AAQ99516) corresp. to nucleotides 50-69 in the human Fas ligand coding sequence given in AAT03498 was synthesised with phosphorothioate linkages. The complementary, antisense oligonucleotide A69 (AAQ99517) was also synthesised. The effects on Fas ligand-mediated apoptosis of A69 and S50 were analysed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide which binds to Fas antigen, and antibody reactive with it - for treatment and diagnosis of viral or auto:immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The F1 Min/Immortomouse and conditionally immortalised cell lines derived from this mouse, carrying the Multiple Intestinal Neoplasia (Min) gene, which predisposes to colon cancer, and a temperature sensitive mutant of the SV40 large T gene which allows growth at certain temperatures, are useful in studies of aberrations of growth and differentiation, including carcinogenesis that may be induced, e.g. by viruses, various genes or mutagens. PCR analysis was carried out to detect the presence of the SV40 large T gene and the Min mutant allele. Most presence of the sylvalissue of mice greater than 2 weeks of age. AAT15588-87 which were used to test for the presence of the Min mutant allele, produced a 280 bp PCR
                  cancer, restenosis, medical conditions mediated by integrins or ceil-cell adhesion receptors, and medical conditions induced by growth factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transgenic animals contg. an immortalising gene and intestinal neoplasia-associated gene - useful in studies of e.g. carcino-genesis, that may be induced by e.g. viruses, various gene or mutagens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an inhibitor of ICAM, and is an example of an oligonucleotide analogues of the invention. The oligonucleotide analogues of the invention are used as inhibitors of gene expression (antisense oligonucleotides, ribozymes, sense oligonucleotides and triplex-forming oligonucleotides), as probes for the detection of nucleic acids, and as auxiliaries in molecular biology. As gene expression inhibitors they may be used for treating viral infections (especially where the virus is BSV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gene expression inhibitor; probe; nucleic acid detection; growth factor; viral infection; therapy; HSV-1; cancer; restenosis; integrin; cell-cell adhesion receptor; ICAM; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New phosphono:mono:ester oligo:nucleotide analogues - inhibitors of gene expression for treating viral infections, cancer, restenosis, etc.
                                                                    Oligo:nucleotide(s) with series of G residués at at least one end have increased stability against nuclease and cell penetration, - are particantisense sequences for treating and diagnosing cancer, viral diseases
                                                                                                                                                                                                                                         Ten- to 40-mer oligonucleotides which have a cap of 1-10 (esp. 4) G residues on at least one end are provided; if caps are present at both ends, they can be of the same or different lengths. A cap sequence increases nuclease resistance of the oligonucleotide and also increases cell penetration. The present sequence is that of a preferred oligonucleotide, directed against an intercellular adhesion molecule sequence, which can be capped for use in anticencer therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

ART30211-T30233, AAT33058-T33112 and AAT36667-T36684 represent antieense oligomucleotides of the invention. These sequences target regions of the coding sequences for human intercellular adhesion molecule-1 (ICAM-1), endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as Eselectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence targets the 3' untranslated region (nucleotides 1952-1971) of ICAM-1. CICAM-1, ELAM-1, and VCAM-1 represent three of the five cell adhesion molecules involved in the adherence of white blood cells to vascular endothelium. These sequences can be used in a composition for treating allograft rejection. The composition ontains one of these sequences in combination with an immunosuppressive agent. The immunosuppressive agent used in the compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal antibody against LFA-1 or an antisense oligomucleotide. The compositions can be used for treating or preventing allograft rejection, such as cardiac or renal allograft rejection. By using these compositions, allograft survival times are extended, and donor-specific

This invention describes novel phosphonomonoester oligonuclectide analogues which act as inhibitors of gene expression (as sense/antisense, ribozyme or triplex-forming molecules), useful as diagnostic agents (i.e. probes for detecting nucleic acid) or for treatment of diseases caused by viruses, influenced by integrins or cell-cell adhesion receptors, induced by factors such as TMF-alpha, or cancer or restenoisis. The products of the invention satisfy the requirements of good in-vivo stability, to cross cellular and nuclear membranes, and specific binding to target nucleic acid better than known oligonucleotides
                                                                                                       Phosphonomonoester analogue; inhibitor; antisense; cancer; restenosis; ribozyme; diagnostic agent; detection; treatment; disease; virus; integrin; cell-cell adhesion receptor; TNF-alpha; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
AAT27481-T27507 are human c-raf kinase antisense oligonucleotides used for the inhibition of raf expression. The oligonucleotides (ONs) are trageted to either coding region, start or stop signals or 5' or 3' untranslated region (UTR) mNAM encoding human c-raf. The ONs may be phosphorothioate linked and may contain modifications at the 2' position of the sugar molety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothioate linked and contain 2''O-alkyl sugar modifications. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis
                                                                                                                                                                                                                           Oligo:nucleotide(s) targetted to nucleic acids encoding human raf capable of inhibiting raf expression, used in treatment of hyper:proliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human potassium channel gene subregion E antisense primer.

either by anti:sense or aptameric effects, useful for enhancing cytotoxic
effects of chemotherapeutic agents on multi:drug resistant cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= a /*tag= a /*tag= a /*tag= a /*tag= a /*tag= a /*note= /*ackbone selected from: phosphorothioate; morpholino dithioate; methylphosphonate; phosphodiester; morpholino backbone; polyamide backbone; and any combination of these backbone types; the backbone may be modified to incorporate a ribozyme structure, or a pendant group"
                                    Human and mouse pancreatic ATP sensitive potassium channel proteins - for diagnosis, therapy and research into potassium channel related diseases, e.g. diabetes.
                                                                                                                                      PCR primers (AATG1868-79) were designed to amplify subregions A-F of the human pancreatic ATP sensitive potassium channel beta-IR gene (see also AATG1866). The antisense primer (AATG1877) for subregions E (494 bp) corresponds to nucleotides 999-1019 of the gene. Cy5-labelled primers were used in the PCR-SSCP analysis of genomic DNA collected from 20 healthy Japanese subjects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a novel oligonucleotide 3(3B)MRP that

```
specifically hybridises in a human cell with a complementary sequence of human multidrug resistance-associated protein (NRP) gene. Hybridisation causes inhibition of expression of the multidrug resistance phenotype by the cell, due to the oligomucleotide having an aprameric inhibitory effect as well as an antisense inhibitory effect. The oligomucleotide is administered to cancer patients to prevent development of the multidrug resistant phenotype. When co- administered with chemotherapeutic agents the oligomucleotide is useful for potentidating elimination of multidrug resistant tumour cells from bone marrow or peripheral stem cell grafts. Also, the oligomucleotide can be used as an immunosuppressive agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer; polymerase chain reaction; PCR; amplification; P16; promoter; ss.

comprising conserved sequences of human immunodeficiency virus and simian
immunodeficiency virus genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 acid amplification of conserved sequences of the gag, vpr, pol or vpu genes of the HIV-1 strains Bru, Mal, Bil, HIV-2 ROD or sinian immunodeficiency virus (SIV) MAC or the neft, vift or vpx genes of HIV-2 ROD and SIV MAC. This primer is taxgetted to sequences in the gag gene of the viral strains. The sequence are therefore used to detect HIV-1, HIV-2 or SIV infections. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PR field.)

AAT47375-T47409 represent amplification primers for the cystic fibrosis transmembrane regulator (CFTR) gene. These sequences can be used as half of the chimeric primers of the invention. The primers are used for amplification of a target DNA sequence, and can be used in a multiplex per amplification. The primers have the sequence 5'-XY-3', where X is a sequence contained within or flanking the target. The contain that does not hybridise to the target sequence (such as AH47344 and Y is a sequence contained within or flanking the target or products are synthesised that contain the chimeric primers on either end. The primers then serve as high stringency recognition sequences for subsequent rounds of amplification. As a result, the annealing efficiency of different primers and their targets in a multiplex amplification of caction is normalised, thereby reducing preferential amplification of certain targets. The chimeric primer comprise a 5' universal domain and a 3' target-specific domain. They are used for the simultaneous PCR amplification of multiple DNA targets in a sample. The primer containing AAT47344 is particularly useful in high-throughput genetic screening for mutations in genes like the CFTR, the Wilms Tumour, and the beta-
                PCR; primer; amplify; polymerase chain reaction; bacteriophage; M13mp18; oystic fibrosis transmembrane conductance regulator gene; multiplex PCR; chimer; genetic screening; mutation detection; CFTR; wilms Tumour gene; beta-thalassaemia gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                            Universal primer used for multiplex DNA amplification - allows simultaneous amplification of multiple DNA target sequences for high through-put genetic screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Forward PCR primer used to amplify a 241 bp fragmnet of CMOAT CDNA

canalidudar multispecific organic anion transporter (cMOAT) protein cDNA.
The PCR product was cloned, and subsequently used in a RNAse protection assay. CMOAT is a new member of the ATP-binding cassette (ABC) transporter family. The ATP dependent CMOAT transporter system mediates transporter family. The ATP dependent CMOAT transporter system mediates chepatobiliary excretion in the liver. CMOAT may be a liver-specific homologue of multidrug resistance associated protein. The mucleic acids are used to provide cells with cMOAT protein activity, cMOAT protein activity, cMOAT protein activity, cMOAT protein activity, cMOAT protein activity in cells can be enhanced by increasing the level of glutathione, glucuromide and/or sulphate. Antisense constructs, especially derived from another multidrug resistance (MDA) related protein, especially derived in a cell. The mucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The mucleic acids and proteins can be used especially in disease involving cMOAT. The cMOAT gene may also be used as a selectable marker gene. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Canalicular multispecific organic anion transporter protein, CMOAT protein, ATP-binding cassette transporter family, ABC transporter,

```
This is the nucleotide sequence of a PCR primer used for amplification in suppressor (MTS) gene, to diagnose and treat cancer. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The westers can be used for gene therapy strategies to replace construct protein in patients. These can also be used to the expression constructs also for therapeutic strategies. In addition the expression constructs can also be used to some the expression constructs can also be used to MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS.
                                                                                                                                                                                                                                                                                                                  Nucleic acids based on multiple tumour suppressor, MTS, sequences -useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS mutation(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Unmethylated CpG dinucleotide; immune response; bacterial meningitis; natural. This sequence represents an unmethylated CpG dinuclectide, and can be used in the method of the invention. The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one unmethylated CpG. The nucleic acids containing an unmethylated CpG than underlynamed containing an unmethylated CpG than underlynamed containing an unmethylated CpG than underlynamed containing an unmethylated CpG than the nucleic acids containing an unmethylated CpG than the nucleic acids containing a numbject by activating natural killer cells (NK) or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. They can be used to treat pulmonary disorders having an immunologic component, such as asthma or environmentally induced airway positive bacterial infections or endotocaemia including bacterial meningitis, neonatal sepsis, cystic fibrosis, inflammatory bowel disease and liver cirrhosis, gram-negative phodominal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primer, amplification, yeast, UAS, upstream activating sequence, transcription terminator; cell cycle, Upstream Activation Sequence, UAS, promocer, phosphorylation, cyclin, cyclin-dependent kinase, CDK; vector, cyclin kinase inhibitor; CKI; growth; wound healing; cancer therapy; ss.

burners AAV60731-V60732 were used to PCR amplify codous 1-149 of the human cyclin-dependent kinase 2 (hCDX2) gene. The amplified product was used to generate a fusion protein compusising part of the hCDX2 sequence linked to codons 154-302 of the yeast PHO85 gene. The fusion protein is used to screen for compounds that affect mammalian cell cycle regulatory proteins. The method comprises administering a compound to a cell line, which contains a reporter gene linked to an Upstream Activation Sequence (UAS) and a promoter, where the UAS binds a transcription control factor (TCF) which is regulated through cyclin/cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene providing a gene product to permit normal cyclin/CDK regulation of the TCF. Expression of the reporter gene is then analysed in the cell line, the method can be used to identify inhibitors and activators of mammalian cell cycle regulatory proteins, especially inhibitors and activators of cyclin/CDK/CKI complexes. The identified agents can be used for stimulating growth of cells (as in wound healing), or regulating coccessive cell growth and division (as in cancer therapy)

                                                                                                                                                                                                                                                                             AAV69949 to AAV69977 represent antisense oligonucleotides which are specifically hybridisable with a region of a nucleic acid encoding human corporate. The antisense compound regulates the expression of the cross protein. The present invention also describes antisense oligonucleotides which regulate the c-Jun protein. The antisense oligonucleotides which regulate the c-Jun protein. The antisense or disorders associated with Activating Protein 1 expression, of which c-Fos and c-Jun are subunits. The antisense oligonucleotides are used in compositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal
                                                                                         Antisense oligonucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA specific for Multiple Tumour Suppressor IEI-beta gene - are useful for the diagnosis of cancers related to MTSIEI-beta mutation(s) and their treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MTS1; MTS1E1-beta; multiple tumour suppressor; diagnosis; cancer; germ-line mutation; familial melanoma locus; MLM; predisposition; ss.

                                Primers AAV11260-V11266 are used in the isolation of the human multiple tunmour suppression proteins, MTS1 and MTS1B1-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9921. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell, (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for detecting expressing an individual, e.g. a fetus are the cell. They can also be used for obtaining cells capable of expressing an homeobox related desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                               Query Match 0.8%; Score 13.6; DB 1; Length 20; Best Local Similarity 80.0%; Pred. The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (c) determining in the first cell and the second cell; (d) determining in a selected gene family; and (c) calculating a positive first cell and the second cell the pattern of expression of genes in a selected genetic defect or characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used
                                                                                                                                                                                                                                               ô
property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA217803-218342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genetic proximity, gene expression, cell characterisation, homeobox gene, genetic defect, reverse transcriptase polymerase chain reaction, RT-PCR, kinase gene, protein phosphatase, P450, steroid receptor, cadherin,

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a of proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the origin of a cell, its can individual, e.g. a fetus. They can also be used for detecting a selected genetic defect in containing cells capable of expressing an homeobox related dealred for obtaining cells capable of expressing an homeobox related dealred containing the pattern of gene expression in a selected gene family. Sequences AALT803-Z18342 repressint primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-FCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This reverse primer was used with a forward primer (see AAZ20187) in the PCR amplification of a poorly conserved 407 bp fragment of bovine pregnancy associated glycoprotein (PAG) PAG1, 5. 6 and 7 cDNA (see AAZ20161, AAZ20164, AAZ20165, AAZ20165. Another primer pair (see AAZ20165-86) was used to amplify a poorly conserved 536 bp fragment of bovine PAG2, 4. 8. 9 or 11 cDNA (see AAZ20162, AAZ20167), AAZ20181). The amplified fragments were used as probes in experiments to demonstrate that certain PAGs, including bovine PAG4, 5, and in the syncytium formed between trophectoderm and uterine epithelium. Such PAGs are useful in immunoassays of the invention for the early diagnosis of pregnancy

The present invention describes two gamma-amino-butyric acid (GABA) B receptor (GABARR) subunits designated HG20 and GABABRIa. Cells expressing the new receptor subunits are useful for identifying GABABR agonists and antagonists. HG20 proteins and their antagonists are useful for inhibiting HG20 or GABABR function, useful for treating depression, eighlepsy, neuropsychiatric disorders, dementias, muscular contractions, and central nervous system disorders. The present sequence represents a PCR primer for human HG20, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, iPFK-2; cancer malignancy diagnostic assay; inflammatory disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotides targeted to human raf mRNA useful for treating and diagnosing abnormal proliferative states and inhibiting raf expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoritasis, or blood vessel restences), and inhibiting raf expression. Sequences AAZ11511-537 and AAZ11555-573 represent antisense oligonucleotides for human c-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

invention relates to a cancer malignancy diagnostic assay for determining the presence of inducible phosphoftructokinase-2 (ippR-2) specific sequences in a sample of a body or tumour fluid or tissue. The assay comprises obtaining a sample of a body or tumour fluid or tissue and performing a sequence identity assay to look for the presence of ippR-2 specific sequences. The method is useful for diagnosis of malignant of ancer by detecting the presence of iPFR-2 specific sequences. Antisense iPFR-2 injouncebotides are useful for treatment of cancer and inflammatory disease. Antagonists of iPFR-2, such as an iPFR-2 enzyme inhibitor or anti-iPFR-2 antibody are also useful for treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a human iPFK-2 antisense oligonucleotide. The invention relates to a cancer malignancy diagnostic assay for determining the presence of inducible phosphofructokinase-2 (iPFK-2) specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, iPFK-2; cancer malignancy diagnostic assay, inflammatory disease, inducible phosphofructokinase-2; tumour; malignant cancer; diagnosis;
                                                                                                                                                This sequence represents a human iPFK-2 antisense oligonucleotide. The
                                                    Cancer malignancy diagnostic assay useful for diagnosis of malignant cancer and, in treatment of cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cancer malignancy diagnostic assay useful for diagnosis of malignant cancer and, in treatment of cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

sequences in a sample of a body or tumour fluid or tissue. The assay comprises obtaining a sample of a body or tumour fluid or tissue and performing a sequence identity assay to look for the presence of iPFK-2 specific sequences. The method is useful for diagnosis of malignant cancer by detecting the presence of iPFK-2 specific sequences. Antisense inflammatory disease. Antagonists of iPFK-2, such as an iPFK-2 enzyme inflammatory disease. Antagonists of iPFK-2, such as an iPFK-2 enzyme and inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV74237-V74253 are oligodeoxynuclectide (ODN) primers used to describe a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-N) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines,

```
Oligonuclectides AAV70607-11 were used to isolate nucleic acid encoding a murine multiple tumour suppressor IEI-beta (MTSIEI-beta) protein. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys. (Updated on 20-MAR-2003 to correct PR field.) (Updated on 20-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAV74293-V74297 are antisense oligonuclectide primers used against the intercellular adhesion molecule ICAV-1 for preventing perfusion injury during transplantation. The oligonuclectides are used for pre-operative treatment of the transplant donor or for pre-treatment of the donor organ (preferably kidney, heart, lung or pancreas) before transplantation

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases can also conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongoncoccal ucetritis, preumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

Genome sequence of Chlamydia trachomatis.

```
PCR primers AAZ01426-Z06209 were used to amplify open reading frames coRFs of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antiennes and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, paratrachoma, paratrachoma, paratrachoma, paratrachoma, paratrachoma, inclusion epidymitis, cervicitis, salpingitis, perimpatitis, bartholinhtis; prehemopathy in breast feeding infants; and venereal lymphogramulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 13.6; DB 1; Length 20;

The method comprises: (a) determining the fraction of each of a set of 13 nearest-neighbour nucleic acid base pair types in a target sequence zone RNA.ASO-DNA hybrid nucleic acid base pair types in a target sequence zone RNA.ASO-DNA hybrid nucleic fractions into formulas to determine the fractions of each of a series of 13 nearest-neighbour nucleic acid base pair types to provide determined fractions, and (c) multiplying the fractions of the 13 nearest-neighbour nucleic acid base pair types by a stability ranking to the nucleic acid antisense sequence, where the results are ordered to produce a ranking. The process is used to rank nucleic acid sequences based on the stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selectively ranking nucleic acid molecules, for inhibitory efficiency comprises determining the fraction a set of nearest-neighbour nucleic acid base pair types in a target sequence zone, substituting nearest-neighbour nucleic acid base pair fractions to determine the fractions and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid oligomer binding interactions to select sequence zones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. 20

CE Primers AAZ10708-33 were used to amplify exons I to 11 of human HKNG1 (Hong Kong new gene 1). HKNG1 is a gene associated with bipolar affective disorder (BAD). HKNG1 polymotleotides are useful to identify compounds modulating HKNG1 gene expression or trivible to the compounds of the compounds inhibiting or enhancing HKNG1 gene expression or activity. Compounds inhibiting or enhancing HKNG1 gene expression or activity. Compounds inhibiting or enhancing HKNG1 gene expression or activity in individuals can then be administered therapeutically to treat HKNG1 mediated disorders, especially neuropsychiatric disorders e.g. BAD, schizophrenia, or HKNG1-mediated myopia disorders, such as early-onset autocominant wyopia. The polymicleotides can be used in gene therapy techniques to treat such disorders. They are also useful in diagnosis to identify individuals having, or at risk of developing, HKNG1 especially result in the production of a protein with a different sequence to the human full-length HKNG1 polypeptide or splice variant sequence to the human full-length HKNG1 polypeptide or splice variant to sequence to the human full-length HKNG1 polypeptide or splice variant cresidue 202 or 184. The polymucleotides are also useful in gene mapping, to produce probes or primers to identify similar sequences (e.g. mutants to be sequences from different species) and to produce transgenic animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; alpha-7 nicotinic receptor; neuronal; hybridisation; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                primers AAX21344-X21345 were used to PCR amplify a 375 bp fragment of the apolipoprotein E gene. The invention relates to the diagnosis of Alzheimer's disease (AD) by detecting one or more mutations, in the genomic region that regulates expression of the apolipoprotein E (apo E), that results in: (a) altered sene expression relative to a control population, or (b) altered relative expression of the alleles of apo E. Alternatively AD is detected by determining the levels of epsilon-2, -3 or -4 alleles or mutations in the Thi/E47cs sequence (a polymorphism in the promotter region). The T allele of Thi/E47cs is associated with increased risk of AD (independently of the effect of the epsilon allele) and increases the risk associated with epsilon 4 in epsilon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing Alzheimer's disease - by detecting mutations in the regulatory region of the apo E gene, or levels of apo E allele expression.
                                                                                                                                                                                                                                                                                   Primer; PCR; amplification; apolipoprotein E; human; brain; diagnosis; Alzheimer's disease; mutation; gene expression; polymorphism; promoter; allele; heterozygote; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
